

Connectivity Solution

There was a day when clinical labs relied on the capabilities of their LIS to provide connectivity to various disparate systems. Those days are over. Data Innovations leads the way with the connections you need to interface automation, instrumentation, information systems and multiple locations. Through the years we've worked with virtually every LIS/HIS, diagnostic equipment manufacturer and a growing number of anatomical pathology systems and EMR/EHR systems. That experience translates into faster, easier installations for you—even if you need to connect more than one LIS or more than one laboratory.

Connectivity through Instrument Manager™ supports:

- Library of 700+ drivers for LIS and instruments
- Interface instruments to multi-LIS systems concurrently
- Capacity for 300+ instruments per system
- Use one system to support multi-locations

- Multiple connectivity options: TCP/IP, serial, File I/O, ODBC and more
- Interfacing instruments directly to one or more EMR/EHR systems
- Connecting to a live and test environment at the same time so you never have to take your instruments out of results production
- One of the only middleware systems 510(k) cleared for use in a blood-bank environment
- Interface microbiology, molecular or esoteric instruments to your information systems
- Interface directly to regional and national reference laboratories for specimen orders and results

With Data Innovations' unique, powerful Notifier application, you can customize the system to send a message to designated recipients whenever a defined event is triggered. For example, if a connection has an error condition.
